MATHEMATICAL SYMMETRY:
A MATHEMATICS COURSE OF THE IMAGINATION

Raymond F. Tennant

Mathematician, Potter, Educator
Address: Department of Mathematics, Statistics and Computer Science, Eastern Kentucky University, Richmond, KY 40475, U.S.A., E-mail: tennant@acs.eku.edu
Fields of interest: Combinatorial group theory and topology, Euclidean and non-Euclidean geometry, Mathematical symmetry, Mathematical art, Creating mathematical pottery, Designing and teaching mathematics courses and art courses which involve connections between mathematics and art.

Members of the symmetry class at Canisius College, fall semester 1992, discussing a project involving Penrose's nonperiodic "kite and dart" tiles. (Left to right) M. Kearns, F. Bochynski, E. Caldero, J. Trost, Ray Tennant, D. Sherman, J. Krutz, and M. Henry.
Abstract: Symmetry forms a natural bridge between the worlds of mathematics and art. It is this connection combined with the creative imagination of students that forms the basis for the mathematical symmetry course that is described below.

THE COURSE - MATHEMATICAL SYMMETRY: A MATHEMATICS COURSE OF THE IMAGINATION

In his classic, Symmetry, Hermann Weyl describes symmetry as the "harmony of proportions". It is this notion that is the common thread running through the university mathematics course titled Mathematical Symmetry: Connections between Mathematics and Art.

A main perspective of the course holds that students have strong visual senses and that they may be introduced more easily to complex ideas by appealing to their geometric intuition. The students explore about ten major topics, including tiling theory, geometry in nature, group theory, non-Euclidean geometry, 3-dimensional tessellations, and fractals. This is done with the aid of straightedge and compass constructions, computer programs, polyhedral models, and examples drawn from the worlds of art and architecture. Each student creates a planar design project and writes a thesis paper involving the imagination. Earlier versions of the symmetry course have been popular with fine arts majors and prospective math teachers as well as students from other disciplines such as psychology, music, history, and engineering. In fact, the classes have been most enjoyable when the students who are participating are drawn from a variety of disciplines.

Goal of the course

The symmetry course covers a number of interesting topics from the world of mathematical symmetry. The class is encouraged to explore geometrical ideas using constructions, computer programs, models, and a variety of other investigative techniques. The spirit of the course is based on the Chinese proverb:

I hear and it helps a little.
I see and ideas begin to form.
I do and ideas become real to me.
I do, see, and hear and I understand.
I talk about it and I understand more.
I apply it and I see it's value.
Picture Syllabus - Mathematical Symmetry

Nature

Constructions

Symmetry Groups

3-Dimensional

Tiling Theory

4-Dimensional

Non-Euclidean Geometry

Fractal Geometry

Topology
Flow of topics

I. Geometry in Nature & Architecture
   The Golden Ratio & Fibonacci Numbers
   Phyllotaxis

II. Geometric Constructions
   Straightedge and Compass Constructions
   Pythagorean Constructions
   Polygon & Star Polygon Constructions
   Geoboard Constructions
   Impossible Constructions

III. Symmetry Groups
   Isometries & Groups of Motions
   Symmetry Group of a Pattern
   Isomorphism of Symmetry Groups
   Cyclic & Dihedral Groups, Group Tables
   Design in Hubcaps & Logos
   Leonardo's Theorem, Frieze Groups

IV. 3-Dimensional Symmetry
   Platonic Solids & Semiregular Polyhedra
   Euler's Formula & Schlegel Diagrams
   Symmetry Motions in Space

V. Tiling Theory
   Regular & Semiregular Tessellations
   Transforming Tilings into "Escher Designs"
   Crystallographic Restriction
   Wallpaper Groups
   Nonperiodic & Aperiodic Tilings

VI. 4-Dimensional Symmetry
   Flatland
   Salvador Dali's "Corpus Hypercubus"
   Hypercubes & N-Dimensional Symmetry

VII. Non-Euclidean Geometry
   The Sphere & the Poincare Disk
   Escher's "Circle Limit IV"
   Hyperbolic Tessellations
VIII. Fractal Geometry
  Von Koch's Snowflake
  Computer Generated Fractals

IX. Elementary Topology & Graph Theory Topics
  Surfaces & Nonoriented Surfaces
  Konigsberg Bridge Problem, 4 Color Problem

X. Geometric Perspective in Art
  Albrecht Dürer's "St. Jerome in His Cell"

The planar design project

For many students in the symmetry course, the 2-dimensional design project has proved to be an exciting and challenging endeavor. Students are free to choose a project from the various topics in the course, e.g., tiling theory, wallpaper groups, color groups, fractals, hyperbolic tessellations, etc. As it develops, each student discusses their project with the class.

Past design projects have included:
* Islamic Tiling Constructions
* Interlocking Ceramic Wallhangings
* A Study of Symmetric Music
* Creating Fractals with Mathematica
* Patterns for the 17 Wallpaper Groups, Using NFL Team Logos
* Color Groups in the Plane
* Straightedge & Compass Constructions for High School Teachers
* Poincaré Disk Constructions
* Symmetry Groups of Molecules
* Needlepoint Crystallographic Groups
* Buddhist Mandala Designs
* Symmetry in Flag Design

The design on the right (less than half its original size) was created by Cindy McCombe in a symmetry class at the University of Southern Colorado in 1994. It shows fish patterns for the 17 wallpaper groups and was created using Adobe Illustrator.
The written project of the imagination

Required reading
Flatland: A Romance of Many Dimensions by Edwin A. Abbott, 1884.

Other possible reading (discuss with instructor)
Sphereland, a Fantasy about Curved Spaces and an Expanding Universe by Dionys Burger and Cornelia Reinboldt, 1965.

Goal of the Assignment
To use writing and the imagination as a way of gaining insight into an abstract land in the world of mathematics (e.g., 4-dimensionland, or even n-dimensionland, the land of fractals, non-Euclidean worlds, topology landscapes, and others.

The research for the paper may involve reading, discussion, the study of a painting, a computer investigation or some other method of discovery. The student will then use imagination to describe an aspect of their abstract world or to create a fictitious story which extends their new world in some way.

Assignment Steps
1. All students read Flatland and are given written assignments to describe aspects of Flatland and then to use their imagination to extend Flatland to areas which are not covered in the book.
2. Each student chooses an abstract world that they wish to investigate.
3. Each student finds a resource (possibly a book, a painting, a computer program, etc.) as the motivating thesis for their paper.
4. Through discussions and rewrites, each student writes a thesis paper about their abstract land. The paper can range anywhere from being scientific to being pure fantasy.
5. The writing projects evolve over the semester and students discuss their progress during class.
Some writing projects of the imagination from past symmetry classes are listed below.

* A Flatland Person Discovers "Up" or "Upward not Northward".
* Police and the Law in Flatland.
* Can 4D-man turn 3-D man inside out?
* The Poincare Pool and Hyperbolic Fish.
* Picasso, Cubism, and the 4th Dimension.
* Fractal Dimension: Between Lines and Planes.
* Magic Squares and Polyhedra in Albrecht Dürer's "Melancholia"
